Inserting Tags with Premier's Large Tag Applicator

** Make sure that the tag is pushed all the way into the applicator. The pin on the male tag and the hole on the female tag should line up before you insert the tag into the animal's ear.*

Fitting Instructions:

1. Place the female part of the tag completely under the spring fingers. The numbers will be down and the tag will be extending away from the tagger. Slide the male tag over the metal pin. The numbers will be up and the tag will extend away from the tagger. If using the female Extra Large Tag and male Button Tag simply slide the male tag over the metal pin.
2. Before you try to insert the tag into the ear, gently squeeze the applicator together to ensure that both the male and female tags are in alignment.
3. Place the ear between the jaws of the applicator, positioning the male tag on the back side of the ear. Make sure the tag is correctly placed as shown.
4. While gripping the ear firmly at the proposed position of the tag, place the point of the tag in contact with the ear close to your thumb. This allows you to feel the vein therefore avoiding it. Completely close the applicator until the tag is inserted through the ear and the female side of the tag.

Tag placement is critical to success!

Tags, especially tags for sheep, must be installed no more than 2 inches from the skull and near the center of the ear.

The opposite extreme (installing too far from the skull) will result in more lost tags as the tissue on the tip of the ear is tender and tears easily.

Be careful to avoid the large vein (shown above).

Inserting Tags in Cold Weather

Plastic tags (all brands) are much easier to install if they are warm. Why? As the temperature drops below freezing plastic becomes less flexible (more stiff) and forcing the male point of a tag through the female takes many more lbs. of pressure (because the female must expand).

So if you care about your hands it's a good idea to keep the tags above freezing in very cold weather. It takes very little to do this. One method is to simply store them while tagging in a small bucket, cardboard box or tool box with a lid alongside a sealed pop bottle full of warm water. The warm water will keep both the air and the tags warmer in the container.
