

Hand Powered Feed Grinder

A useful and handy item for grinding small, custom and/or organic feed rations of various grain types for poultry. Assemble according to the instructions on the box. Permanently bolting to a board or table is recommended for frequent and heavy usage. Included support brackets are sufficient for light and occasional usage.

Adjust the black turn dial to set the size of your end product. Tightening it clockwise decreases the size of the product (all the way tightened produces flour - which is fine enough to make cornbread). For cracked corns/grains turn the dial counterclockwise until the grinder produces the desired kernel size for your needs.

Turn the crank to grind feed. A collection bin underneath should be used to make the process clean and allow you to measure and mix your ration to specification.

Tip: If you want to go from grinding cracked corn to a finer particle size, it is recommended that you clean the hopper and grinder before adjusting the dial. You can adjust during grinding, but it will require you to wiggle the crank handle and tighten the black dial repeatedly to reach the desired size.
