

# Nylon Ram Breeding Harness

## Features

- Improved materials and designs.
- Snap connections are easier and quicker to use than metal or nylon buckle.
- Adjustable—fits even the largest rams.
- Crayons easily changed. See on back.

## Fitting Instructions:

1. Identify the straps.
  - a) The shoulder straps are the straps with male buckles only.
  - b) The girth strap is the strap with metal rings and buckles.
2. Fasten the girth strap first. With the crayon holder in position between the ram's front legs, bring the girth strap with the male buckle over the back of the ram and snap it into the female buckle. Adjust strap to a tight fit.

3. Fasten the shoulder straps next. Pull one shoulder strap up each side of the ram's neck, cross it diagonally over its shoulder and buckle it to the metal ring on the opposite side of the girth strap.

The two shoulder straps should cross on top of the ram's shoulders and be adjusted so that the crayon holder lies securely and centrally between the ram's front legs.

4. The harness may need to be readjusted after the first 1 - 2 days to compensate for settling in. Look at your ram every day to see if an adjustment is needed or if a new crayon should be installed.

# Marking Crayon Insertion Instructions

1. Marking crayon in plastic crayon protector.

2. Cut the label in the middle to reveal the metal coter pin. The plastic pins are provided loose.

3. Turn holder back over and take the plastic cap off (protects crayon during transport).

4. Slide the crayon into the harness by inserting the narrow end first.

4. Metal Coter Pin - Take the coter pin and push all the way through the middle holes of the harness. Once the coter pin is pushed through all the way bend back the ends flush with the crayon.

5. Plastic Pins (optional) - Use instead of the coter pin. Push pins in holes on each side of harness.
